AMENDMENTS TO THE CLAIMS:

The listing of claims will replace all prior versions, and listings of claims in the application:

LISTING OF CLAIMS:

1. (currently amended)   A system for generating a requisition for user selectable <u>inventory</u> items comprising:

a client computer system connected to a network;

a server computer system connected to the network, the network interconnecting the client computer system and the server computer system, the client computer configured to allow a plurality of users to access the server computer system, the server computer system configured to:

associate one or more of a plurality of work sites with each of said users, each worksite defining a group of users;

associate <u>inventory</u> items with one or more of a plurality of work sites using <u>a</u> validation rules <u>database associating each of said user selectable items with one or more of a plurality of work sites with which a user must be associated to verify the user requested inventory item for a requisition</u>;

identify associated <u>inventory</u> items which may be requisitioned by a user associated with the one or more associated work sites, and identify associated <u>inventory</u> items which may not be requisitioned by a user associated with the one or more associated work sites;

receive and process a request for one or more user selected <u>inventory</u> items;

verify that each user requested <u>inventory</u> item is an item associated with the user's one or more associated work sites; and

generate a requisition for the verified user requested <u>inventory</u> items.

2. (original)   The system of claim 1, wherein the client computer system comprises a web browser for accessing the network and communicating with the server over the network.

3. (original)   The system of claim 1, wherein the server computer system comprises a requester database containing one or more of an user identifier, a password, and personal information for the plurality of users.

4. (original)   The system of claim 3, wherein the requester database contains at least one shared user entry, the shared user entry associated with a single work site.

5. (original)   The system of claim 3, wherein the server computer system further comprises a work site database associating at least one of a plurality of work sites with each of the plurality of users.

6. (currently amended)   The system of claim 5, wherein the server computer system further comprises an inventory database containing information about the user selectable inventory items.

7. (currently amended)   The system of claim 6, wherein said information comprises one or more of an item inventory identifying indicia, an item description, and an image representation of each item.

8. (canceled)

9. (currently amended)   The system of claim 1, further comprising a database storing a list of inventory items preselected by the user to be used at a later time to create a requisition.

10. (original) The system of claim 1, further comprising a requisition database containing information about previously generated requisitions.

11. (currently amended)   A method for generating a requisition for user selectable inventory items over a network between a client computer system connected to the network and a server computer system connected to the network,

3

the network interconnecting the client computer system and the server computer system, the method comprising the steps of:

assigning to one or more users one or more of a plurality of work sites, each work site defining a group of users;

assigning <u>inventory</u> items to one or more of a plurality of work sites using <u>a</u> validation rules <u>database associating each of said user selectable items with</u> <u>one or more of a plurality of work sites with which a user must be associated to</u> <u>verify the user requested inventory item for a requisition</u>;

identifying assigned <u>inventory</u> items which may be requisitioned by a user assigned to the one or more work sites, and identifying <u>inventory</u> items which may not be requisitioned by a user assigned to the one or more work sites;

receiving a request for the requisition of one or more <u>inventory</u> items selected by a user;

verifying that each requested <u>inventory</u> item is an item associated with the user's one or more associated work sites<u>, the step of verifying comprising</u> <u>retrieving previously stored validation rules associating each of said selectable</u> <u>inventory items with one or more of a plurality of work sites with which a user must</u> <u>be associated to verify the inventory item for a requisition</u>; and

generating a requisition for the verified user requested <u>inventory</u> items.

12. (original) The method of claim 11, wherein the client computer system comprises a web browser for accessing the network and communicating with the server over the network.

13. (original) The method of claim 11, wherein the client computer system and the server computer system communicate via the Internet.

14. (previously presented) The method of claim 11, further comprising the step of identifying the user and retrieving information previously stored for the user.

4

15. (previously presented) The method of claim 11, further comprising the step of providing at least one shared user account for use by multiple users, the shared user account associated with a single work site.

16. (previously presented) The method of claim 11, further comprising the step of providing at least one managerial account associated with a single work site and allowing a user to generate a requisition for any other user associated with said single work site.

17. (original) The method of claim 14, wherein the step of assigning a work site to a user is performed by retrieving previously stored information associating each user with at least one of a plurality of work sites.

18. (currently amended) The method of claim 17, further comprising the step of displaying previously stored information about user selectable inventory items.

19. (currently amended) The method of claim 18, wherein the previously stored information comprises one or more of an inventory item identifying indicia, an inventory item description, and an inventory item image representation.

20. (canceled)

21. (currently amended) The method of claim 11, further comprising the step of displaying a previously stored list of inventory items preselected by the user to be used at a later time to generate a requisition.

22. (previously presented) The method of claim 11, further comprising the step of displaying previously stored information about previously generated requisitions.

23. (currently amended) A computer readable medium whose contents cause an information handling system to execute method steps for

generating a requisition for user selectable <u>inventory</u> items over a network between a client computer system connected to the network and a server computer system connected to the network, the network interconnecting the client computer system and the server computer system, the method steps comprising:

assigning to one or more users one or more of a plurality of work sites, each work site defining a group of users;

assigning <u>inventory</u> items to one or more of a plurality of work sites using <u>a</u> validation rules <u>database associating each of said user selectable inventory items with one or more of a plurality of work sites with which a user must be associated to verify the user requested inventory item for a requisition;</u>

identifying assigned <u>inventory</u> items which may be requisitioned by a user assigned to the one or more work sites, and identifying <u>inventory</u> items which may not be requisitioned by a user assigned to the one or more work sites;

receiving a request for the requisition of one or more <u>inventory</u> items selected by a user;

verifying that each requested item is an <u>inventory</u> item associated with the user's one or more associated work sites<u>, the step of verifying comprising retrieving previously stored validation rules associating each of said selectable inventory items with one or more of a plurality of work sites with which a user must be associated to verify the</u> inventory <u>item for a requisition;</u> and

generating a requisition for the verified user requested <u>inventory</u> items.
